Introduction

At the moment the ITU Radio Regulations end at 300 GHz. At a next WARC 300-1000GHz might be allocated and f.i. ARRL already is studying which segments could be useful for amateur allocations.

In some Region 1 countries amateurs have a national allocation >300 GHz; in other countries amateur use of frequencies >300 GHz is forbidden.

Finally there are several reports from amateurs using frequencies above 300 THz for experimental contacts.

Region 1 role

The VHF/UHF/Microwaves committee is requested to reflect on this situation and discuss the following aspects:

- Is there a need for inclusion of amateur bands/activities between 300 an 1000 GHz in our work (bandplanning, contesting etc)
- Is there a need for coordination and /or stimulation of amateur activities > 300 THz ?
- Are there other aspects?
