No change to the activity segments of the 76 and 241 GHz R1 bandplan

Introduction

This paper recommends to reject any changes to the activity segments of the 76 and 241 GHz R1 bandplan.

Background

There have been for quite some time plans to change the bandplans for the narrow-band activities in the above mentioned frequency bands.

The reason for this in the 76 GHz band is the introduction of new automobile- radar systems.

In the 241 GHz band the change may be justified by the primary exclusive status of the proposed new band segment.

Keypoints

The DARC prefers no change to the activity ranges in the microwave bands. In the 76 GHz band the activity is relatively low. The active users in Germany don´t expect any problems from the automobile radar systems.

In the 241 GHz band those few active amateurs don´t expect any problems in this actual activity segment. It makes no sense to have to change the equipment in use without any practical advantage.

Resolution

It is suggested to have no change to the activity segments in the 76 and 242 GHz bandplans.
